

Holder for Use in Semiconductor or Liquid-Crystal Manufacturing Device and Semiconductor or Liquid-Crystal Manufacturing Device in Which the Holder Is Installed

Abstract

Affords a holder for use in semiconductor or liquid-crystal manufacturing devices—as well as semiconductor or liquid-crystal manufacturing devices in which the holder is installed—in which temperature uniformity in the processed-object retaining face is heightened. Configuring the holder with, furnished atop a ceramic susceptor, a composite of a ceramic and a metal improves the temperature uniformity in the holder's processed-object retaining face and makes for curtailing the generation of particulates and other contaminants. In addition, putting a coating on at least the retaining face improves the durability of the holder. Installing a holder of this sort in a semiconductor manufacturing device or a liquid-crystal manufacturing device contributes to making available semiconductor or liquid-crystal manufacturing devices whose

productivity and throughput are excellent.
